Features Completed/In progress:

All of our features are in progress. We have walking distance and Bus time both as a part of our API call, however they are not yet displayed on our map. The highlighted routes and interactive map features are both completed. User Profiles and Feedback are both in progress. We have our database set up for both as well as input fields on our front end to put them in the database. All that is left is to integrate the two for those two features.

Working parts of Live demo:

Most of our features worked during the demo. We were able to successfully show a route on our interactive map with a highlighted demo. We also have a working login page.

Struggles:

We have not yet integrated our database and our actual client yet, so the user profiles are not yet completed. We have also ran into an error where occasionally the API believes we are in a completely different area than we are or the destination/origin we input is not the closest one (for example a 30th street in California rather than boulder).

Suggestions:

Cory suggested changing our front end so that it would look better on a mobile device. We could change the calls on each so that the application would work differently on mobile screens compared to computer screens. He also suggested that we sort the place inputs by proximity to our assumed location.
